# Young ruminants

[www.sheep101.info/cud.html](http://www.sheep101.info/cud.html)

- At birth, the lamb's rumen and reticulum are not yet functional. As lambs begin to nibble on dry feeds, these two compartments become

"innoculated" with microorganisms.

As the **microbes** multiply and begin to digest feed, they stimulate the growth and development of the rumen and reticulum. The lamb's rumen and reticulum are usually functional by the time it is 50 to 60 days old.

## Macroscopic structure of ruminal epithelium

# Ruminal papillae

## Microscopic structure of ruminal epithelium

# Rumen epithelial cell culture

# Electronmicroscopic structure of ruminal epithelium

# Ruminal microbes in the rumen fluid: mixed culture (bacteria, protozoa, fungi)

[www.admani.com/AllianceBeef/TechnicalEdge/Rum...](http://www.admani.com/AllianceBeef/TechnicalEdge/Rum...)

# Ruminal microbes in the rumen fluid: rumen **bacteria** [www.mekarn.org/procbuf/wanapat.htm](http://www.mekarn.org/procbuf/wanapat.htm)

- Attachment of rumen bacteria on rice straw of swamp buffalo, Bar = 16  $\mu\text{m}$

# Ruminal microbes in the rumen fluid: rumen **protozoa** [www.mekarn.org/procbuf/wanapat.htm](http://www.mekarn.org/procbuf/wanapat.htm)

- Rumen protozoa

# Ruminal microbes in the rumen fluid: rumen **protozoa** [www.mekarn.org/procbuf/wanapat.htm](http://www.mekarn.org/procbuf/wanapat.htm)

- Rumen protozoa, *Entodiniomorph* sp. of swamp buffalo

# Ruminal microbes in the rumen fluid: rumen **fungi** [www.mekarn.org/procbuf/wanapat.htm](http://www.mekarn.org/procbuf/wanapat.htm)

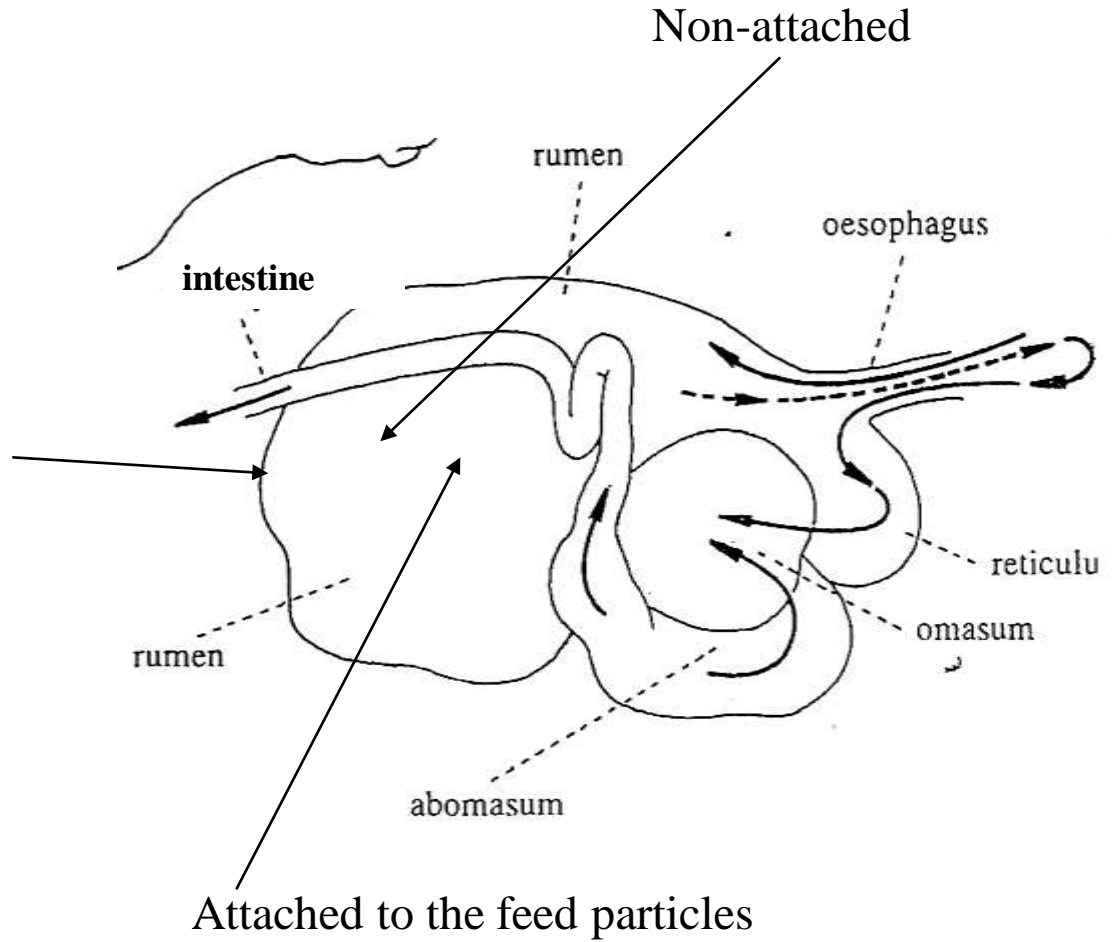

- Rumen fungus of swamp buffalo, *Anaeromyces* sp.

# Distribution of microbes in the rumen

Attached to the rumen wall

# Microbial population [www.admani.com/AllianceBeef/TechnicalEdge/Rum...](http://www.admani.com/AllianceBeef/TechnicalEdge/Rum...)

- The type of microbes which are most efficient at deriving nutrients from feedstuffs will be the dominant population in the rumen. For example, a forage-based diet will encourage a forage-digesting microbial population to dominate the rumen. **Changing diets will cause a shift in the microbial population from one set of species to another.** The change in microbial population is one reason why diets should be changed gradually. Rapid changes in type or quantity of diets can result in rapid changes in the microbial populations, which in turn can cause digestive upsets, such as acidosis or bloat.

# Microbial carbohydrate degradation in the rumen

VFA=acetate, propionate, butyrate

[capra.iespana.es/.../fermentacioning.htm](http://capra.iespana.es/.../fermentacioning.htm) Ratio of VFA in the rumen fluid

Molar ratios of VFA: Diet of Hay

# Loss of methane by eructation [www.slic2.wsu.edu:82/.../pages/Chap20.html](http://www.slic2.wsu.edu:82/.../pages/Chap20.html)

# Energy produced from degradation of VFA (%)

<b>Species</b>	<b>Forestomach</b>	<b>Large intestine</b>
cattle	70-80	0-15
sheep	57-79	0
goat	37-46	
deer	25	
langurmonkey	100	
rabbit		8-12
rat		9
pig		5-28
human		0,7-10

# Fate of absorbed VFA in the tissues of the host

Acetate  $\rightarrow$  AcCoA

liver

Adipose tissue,  
Mammary gland

Propionate  $\rightarrow$  Propionyl-CoA

liver

Mammary gland

Butyrate  $\rightarrow$  Butyryl-CoA

liver

# Glucose metabolism of the host

# Microbial protein metabolism in the rumen

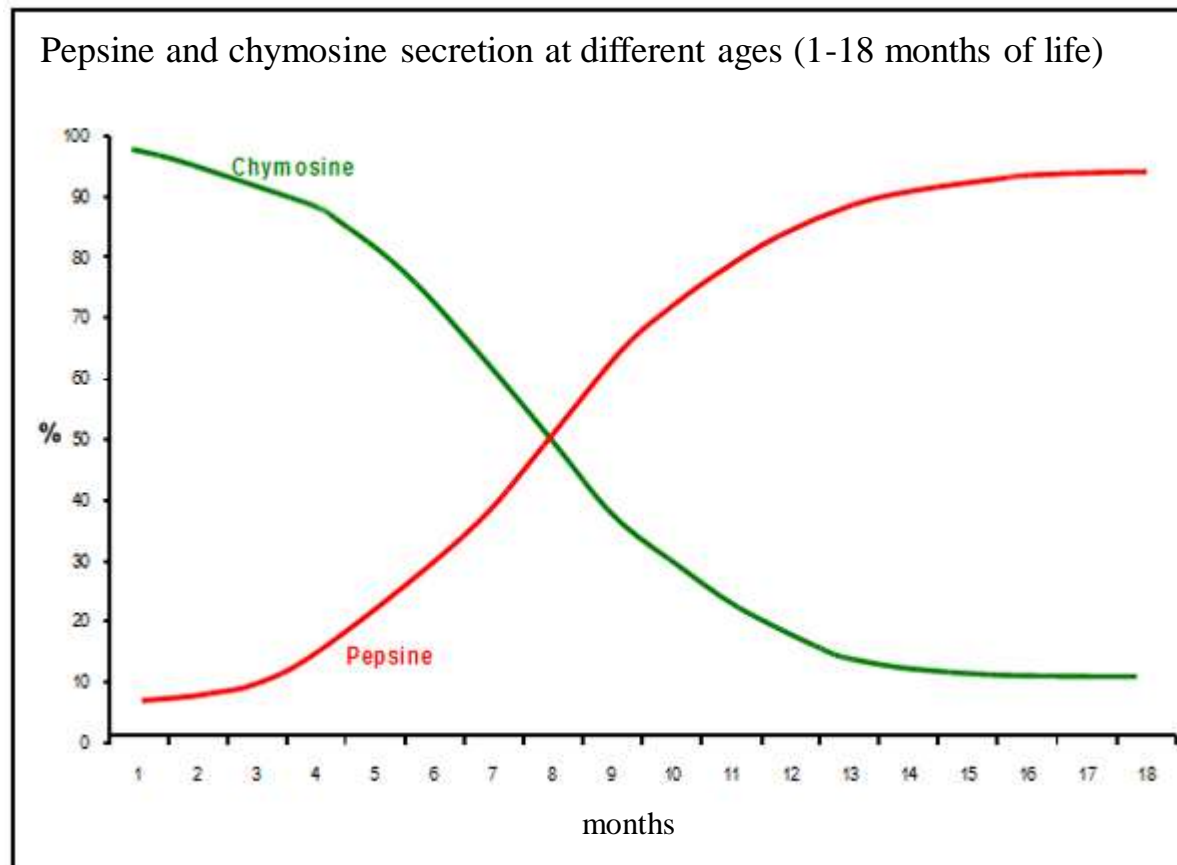

# Degradation of microbial protein

<http://www.laboratoires-abia.com/en/change-in-levels-of-chymosin-and-pepsin-in-the-abomasum-of-cattle.html>

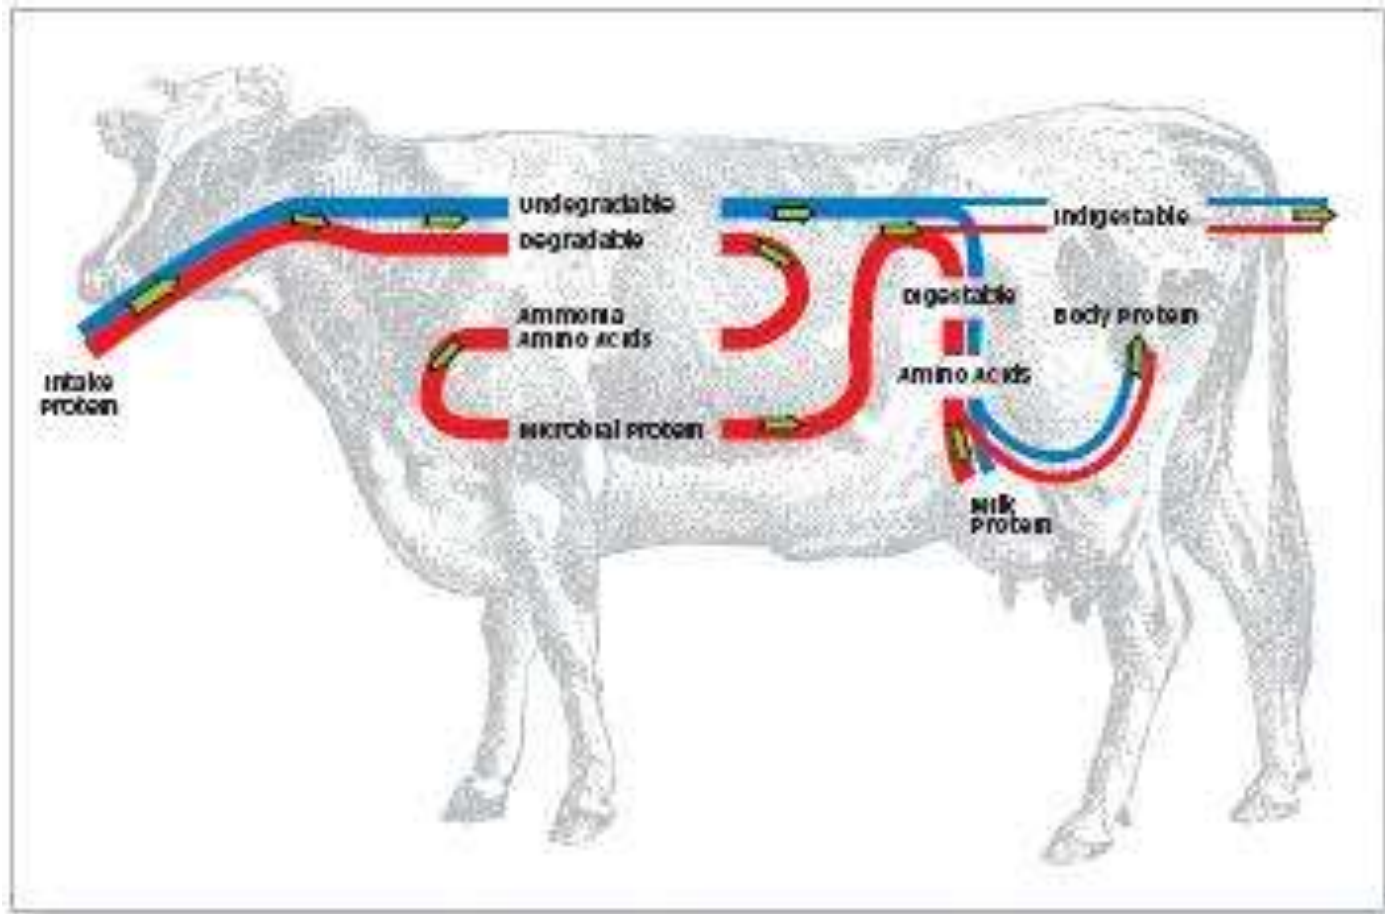

- By pepsin in the abomasum
- By pancreatic trypsin
  
- At the birth of the animal, the abomasum of young calves contains mainly chymosin=rennin (> 80% of the enzyme content). This is because that the animal consumes only milk.
- Chymosin is the specific enzyme of milk digestion, hence the major secretion.
- Gradually, as the animal grows its nutrition evolves from a diet based on milk to a mixed diet. The consequence of this food change is a drop in the rate of chymosin for the benefit of increased secretion of bovine pepsin. To eight months, the content of pepsin in the stomach becomes higher than that of chymosin. At this stage, we speak of weanlings. In adulthood, pepsin is practically the only enzyme present. See next slide!

# Change in levels of chymosin and pepsin in the abomasum of cattle

<http://www.laboratoires-abia.com/en/change-in-levels-of-chymosin-and-pepsin-in-the-abomasum-of-cattle.html>

# Bypass proteins [www.farmwest.com/index.cfm?method=library.sho...](http://www.farmwest.com/index.cfm?method=library.sho...)

# Bypass protein made: from soymeal

- SoyPass

# Microbial fat metabolism in the rumen

## Trans fatty acids produced in the rumen

CLA (1. and 2.)

„normal” linoleic acid (3.)

Products of biohydrogenation:

1.) 18 carbon, 11 trans double bond=**vaccenic acid**

2.) CLA=conjugated linoleic acid=18 carbon, 9 cis, 11 trans double bonds=rumenic acid

# Synthesis of fats in ruminants' tissues

- **Origin of fatty acids:**
- 1. dietary
- 2. microbial
- 3. „de novo” synthesis in adipose tissue

# Comparison of „de novo” fatty acid synthesis in the tissues of ruminants

	<b>Non-ruminants</b>	<b>Ruminants</b>
Source of carbon	Glucose	Acetate
Starting compound of fatty acid synthesis	AcCoA	AcCoA
Source of NADPH+H <sup>+</sup>	<ol style="list-style-type: none"><li>1. Pentose phosphate pathway</li><li>2. Malate (=malic) enzyme</li></ol>	<ol style="list-style-type: none"><li>1. Pentose phosphate pathway</li><li>2. Cytosolic isocitrate dehydrogenase</li></ol>

# Correlation between gluconeogenesis (GNG) and ketogenesis

- Early lactation  High yielding cows

 Negative energy balance

## Ketone bodies

- During high rates of fatty acid oxidation, primarily in the liver, large amounts of acetyl-CoA are generated. These exceed the capacity of the TCA cycle, and one result is the synthesis of ketone bodies, or ketogenesis.
- Liver mitochondria have the capacity to convert acetyl CoA derived from fatty acid oxidation into ketone bodies.
- The ketone bodies are acetoacetate,  $\beta$ -hydroxybutyrate, and acetone.

Acetoacetate

D- $\beta$ -Hydroxybutyrate

Acetone

# Ketogenesis, ketolysis

- Ketogenesis: liver (mammary gland, rumen wall: only beta-OH-butyrate)
- Ketone bodies (acids): **negative role: ketoacidosis**
- **Positive role: energy source** (ketolysis)
- Ketolysis: extrahepatic tissues

# Primary and secondary ketosis

- 1. **Primary:** because of a high energy demand  
     energy intake is not sufficient
- 1a. Early lactation of high yielding cows
- 1b. Pregnancy toxaemia in sheep and goats  
(ewes/does pregnant with twins or triplets)
- 2. **Secondary:** because of insufficient quantity of feed or an other illness (gastrointestinal diseases, mastitis, metritis, no appetite)  
     energy intake is not sufficient.

# Milk fat: cca. 3.5%

- Triacylglycerols (uptake from blood plasma and synthesized in the mammary gland from acetate or butyrate)
- Phospholipids (uptake from blood plasma)
- Cholesterolesters (uptake from blood plasma)
- Free fatty acids (uptake from blood plasma and synthesized in the mammary gland from acetate or butyrate)
- Fat soluble vitamins (uptake from blood plasma)

## Effect of diet on the VFA production and milk fat %

[http://animsci.agrenv.mcgill.ca/courses/450/extra/feed\\_to\\_milk/microbio.htm](http://animsci.agrenv.mcgill.ca/courses/450/extra/feed_to_milk/microbio.htm)

<http://beyondorganicsinside.blogspot.com/>

Figure 2. Ruminal fermentation as a consequence of adaptation due to pH regulation.

More forage-  
(concentrate=  
**grain**) rich  
diet → Less  
saliva →

Lower pH →

**Less acetate  
and milk  
fat%**

Kaufman, W., H. Hagemester, and G. Durksen. Adaptation to changes in dietary composition level and frequency of feeding. In: Digestive Physiology and Metabolism in Ruminants, ed. Y. Ruckebusch and P. Thivend. Westport, Ct.: AVI Publishing, 1980, p. 587.

# Effect of diet on the VFA production and **milk fat%**

[http://www.sciencenews.org/sn\\_arc98/9\\_19\\_98/food.htm](http://www.sciencenews.org/sn_arc98/9_19_98/food.htm)

- More roughage (**fiber**)  
hay ↓
- More saliva ↓
- Higher pH ↓
- **More acetate-**  
producing microbes ↓
- **Higher milk fat%**

# Milk sugar=lactose: cca. 4.8%

- De novo synthesis in the mammary gland: from propionate in the gluconeogenesis (GNG) is produced glucose, from glucose galactose and then lactose (see: Galactose metabolism)

Lactose: Galactose and Glucose bound by Beta 1, 4 bond

# Milk protein: cca. 3.3%

- Casein: 2.6% („de novo” synthesis in the mammary gland)
- Beta-lactoglobulin: 0.3% („de novo” synthesis in the mammary gland)
- Alpha-lactalbumin: 0.1% („de novo” synthesis in the mammary gland)
- Milk serumalbumin and immunoglobulins: 0.1% (uptake from the blood plasma)

Structure of **casein (milk protein)**: different caseins ( $\alpha$ -s1,  $\alpha$ -s2 and  $\beta$ ) held together by calcium phosphate bridges on the inside, surrounded by a layer of  $\kappa$ -casein which helps to stabilize the micelle in solution

- <http://www.milkfacts.info/Milk%20Composition/protein.htm>

# Colostrum

- Colostrum, or first milk produced by the mother after birth, is high in nutrients and antibodies. A newborn calf lacks disease protection because antibodies do not pass across the cow's placenta to the fetus' circulatory system. Antibodies in colostrum provide calves with their initial protection.
- Calves need about two quarts of colostrum (or at least five percent of the calf's body weight) within four hours of birth – ideally within 30 minutes – and one gallon within 12 hours.
- Time is important because a newborn calf's digestive tract allows antibodies to pass directly into the blood. After 24 hours, the calf's intestines cannot absorb antibodies intact. The absorbed antibodies protect against systemic invasion by pathogens while antibodies that are not absorbed play an important role in protection against intestinal disease.
